Deadpool Logo Art with Python Turtle

Description

This project creates a simple and visually striking Python program that draws the iconic Deadpool logo using the turtle graphics library. It features a bold red outer ring, a central vertical red bar, and the character's signature white, squinting eyes against a dark background.

The program demonstrates basic concepts in Python graphics, including:

- Drawing shapes (circles and polygons)
- Using functions to modularize code
- Precise coordinate placement
- Simple geometric transformations (using a multiplier to mirror shapes for symmetry)

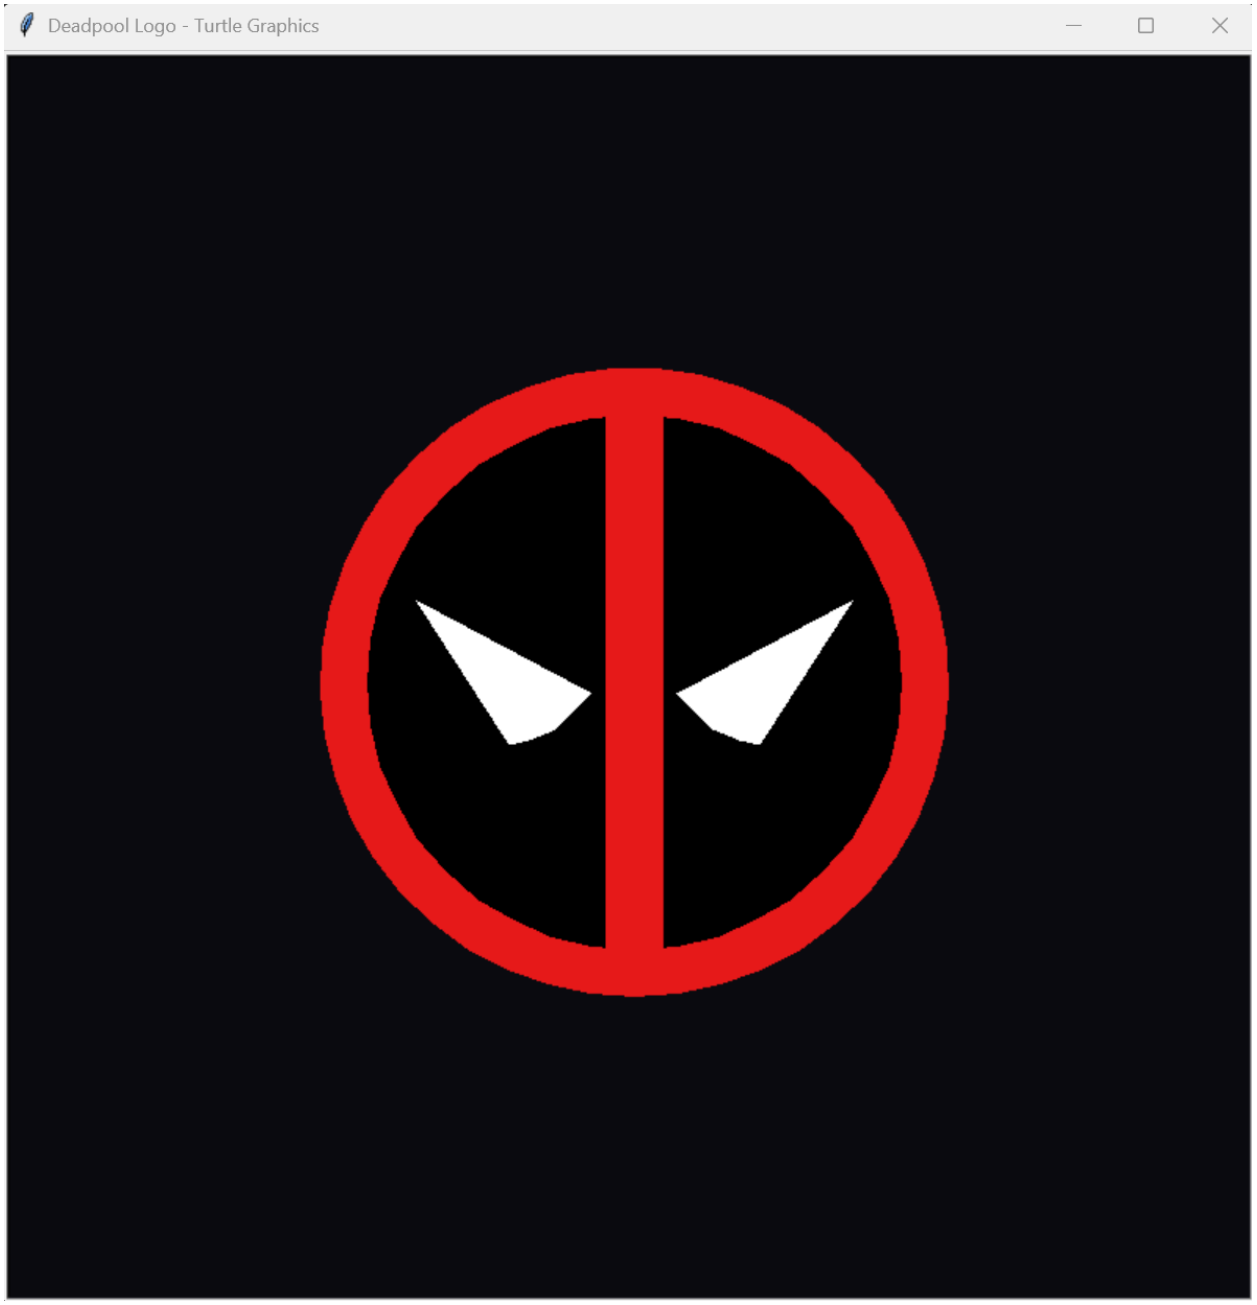

Code Overview

The project is structured around simple, straightforward turtle commands and reusable functions:

- The Main Sequence – Uses basic `pen.goto()`, `pen.circle()`, and `pen.begin_fill()` commands to construct the large red circle, the inner black circle (which naturally creates the red ring), and the vertical center bar.
- `draw_eye(pen, side)` – A helper function that draws the angled white eye shape. It uses a simple multiplier (`side = -1` for the left eye, `side = 1` for the right eye) to perfectly mirror the shape without needing complex math.

The precise coordinates make each execution exact, creating a sharp, clean comic-book effect.

Example Output

How to Run

1. Clone or download this repository.
2. Open the project file in your Python IDE or text editor (e.g., `deadpool_logo.py`).
3. Run the program:

Bash

```
python deadpool_logo.py
```

4. A window will open showing the Deadpool logo.
5. Click anywhere in the window to close it.
